It is recommended that the users of this publication seek legal, accounting and other independent professional business advice before starting a business or acting upon any advice given. This book is not intended for use as a source of legal, business, accounting or financial advice, but is distribute for information purposes only.

## Acid Test For Gold

### How You Can Find the Number of Karats in Gold

If you wish to find out if a piece of jewelry is made of gold, touch it with a glass stopper which has been wetted with nitric acid. If it is pure gold it will remain untouched and unchanged; if not, the solution will become blue from the formation of nitrate of copper. (False "gold" always contains copper.)

To find the number of karats in a gold object is not as easy as testing for gold content. First, weigh the gold object. Then break it up and mix it with seven times its weight in silver. Beat this mixture into thin leaves and then add nitric acid. The silver and copper will dissolve. Now fuse the remaining gold and weigh it. Compare the first and last weights: the difference will be equal to the number of karats of pure gold. Repeat several times to check.
